Problem Statement

For a base number X , the product of multiplying it Y times is called X to the Y -th power and represented as $\text{pow}(X, Y)$. For example, we have $\text{pow}(2, 3) = 2 \times 2 \times 2 = 8$.

Given three integers A , B , and C , compare $\text{pow}(A, C)$ and $\text{pow}(B, C)$ to determine which is greater.

Constraints

- $-10^9 \leq A, B \leq 10^9$
- $1 \leq C \leq 10^9$
- All values in input are integers.

Input

Input is given from Standard Input in the following format:

$A \ B \ C$

Output

If $\text{pow}(A, C) < \text{pow}(B, C)$, print $<$; if $\text{pow}(A, C) > \text{pow}(B, C)$, print $>$; if $\text{pow}(A, C) = \text{pow}(B, C)$, print $=$.

Sample 1

Input	Output
3 2 4	>

We have $\text{pow}(3, 4) = 81$ and $\text{pow}(2, 4) = 16$.

Sample 2

Input	Output
-7 7 2	=

We have $\text{pow}(-7, 2) = 49$ and $\text{pow}(7, 2) = 49$.

Sample 3

Input	Output
-8 6 3	<

We have $\text{pow}(-8, 3) = -512$ and $\text{pow}(6, 3) = 216$.
